

COVID-19 & Staying Safe in the Fall

Stay safe and sound as the pandemic continues to linger and the Delta variant spreads.

What You Should Know About the Delta Variant

▼
It's more than two times more contagious than previous variants.

Data suggests it causes severe illness in the unvaccinated.

Unvaccinated people are much likelier to be affected by the Delta variant.

For the Fully Vaccinated
You **don't** need to wear a mask in outdoor settings unless you feel safer doing so.

Consider wearing a mask anytime you may be in **close contact with unvaccinated people, indoors or outdoors.**

Fully vaccinated people with underlying medical conditions, or those who have weakened immune systems, should continue taking full precautions.

The CDC recommends that the **forementioned group receive an additional dose to maximize their protection against COVID-19.** The additional dose is not the same as a booster dose, and is currently not recommended for any other group of people at this time.

Choose your social events wisely.
The safest events are:

Not crowded

Outdoors with people you know are vaccinated

▼
Still Unvaccinated?

A small subset of people cannot receive a vaccine due to allergies or other pre-existing conditions. If you are healthy and age 12 or older, protect those who can't get vaccinated and schedule your vaccine today.
